Archaeogeography is a discipline that ‘deals’ with the dynamics of space over time. It helps to explore new dimensions of geo-historical objects, in a different way than used before by the disciplines of historical geography, the geo-history, landscape archaeology or environmental one.

Archaeogeography is still young in its formalization (Chouquer 2007, 2008; Robert 2003; Robert & Costa 2009; Watteau, 2009), but already changing in its concepts. If it search to integrate the elements of human presence in space planning in reading about the long term, other issues need to be consider. It looks at specific cartographic and photographic documentation by associating the various sources of information in a cumulative process that can read inheritances, recurrences and innovations in land use. Data from aerial photography and satellite will occupy an important place.

Today, archaeogeography is used in research in the history of landscapes, local history and geography, in France where the discipline was formalized, and in other countries (see indicative bibliography). This research may find a resonance with European partners who use steps and a close or similar intellectual posture.
